

FREESCO 0.2.7: Why does FREESCO redial every 20 minutes ?

You probably have a Win9x host on your lan, and it is checking names every so often.

The gist of the deal is this: Set your Win9x hosts to use the FREESCO box as their nameserver. Then make sure you have DNS (caching nameserver) enabled on the FREESCO box. Edit the /mnt/router/etc/named.hst and namedxx.rev (where xx is the number of the private address class you are using i.e. 10, 172, or 192). Make entries like the examples within for your local hosts. Save the files. Reboot the freesco box. Then don't worry about it.
