

## *Generic: Why does my keyboard swap characters that I type around?*

*(e.g. press # and \$ is shown on screen)*

This is invariably due to using a keyboard with a language other than US. Different language keyboards (among which even UK keyboards are included) have different symbols in different positions.

There is a quick and easy fix for this. Download the **modules-027.zip** file from the same place you downloaded Freesco. Extract it and inside the extracted directory you should find a /keymaps directory and a file called keymaps.txt which contains the instructions for installing a more suitable keymap to your Freesco floppy.

Briefly, installation of a new keymap involves copying the relevant .gz file from **modules-027.zip** to the /router/kbd directory on the floppy (accessible as /mnt/router/kbd from inside Freesco) and then rebooting the Freesco machine.
