

Web server (thttpd): thttpd 2.20b installation breaks public HTTP server (No pages can be seen)

After the thttpd 2.20b package (FREESCO 0.2.7) installation the virtual host option is default enabled.

See the man page [here](#) for details.

The effect of this option for a default freesco box is that the public website does not seem to work anymore.

Here it the fix:

edit the thttpd startup script in `/rc/rc_httpd` and remove the `-v` option for the public HTTP server. look for the next lines:

```
echo -n "Starting public http server... "  
/mnt/router/packages/thttp/thttpd -p $WWWPORT .....
```

remove the `-v` option and save the modified file.

Then type **rc_httpd restart** and all will be back to normal.
