

Web server (thttpd): Should I use the FREESCO web server as a public web server?

Better not. The stock FREESCO web server is based on [thttpd](#) 2.05, which is a rather ancient version (check the [release notes](#)) and contains bugs that could possibly be exploited by malicious users.

If you have sufficient RAM then consider installing the Apache package that is available for both FREESCO 0.2.7 and 0.3.x series.

If you think Apache is too complex or stressing the available resources of your FREESCO box, then install the thttpd+ package by Icy K. These packages are unfortunately not available on [FREESCOSoft](#) but the package is available on my server as well.

```
pkg -i http://dingetje.homeip.net/packages/0.3.x/thttpd+_php-4.2.3_the.icy.k
```
