

Generic: Creating a "report"?

FREESCO has a script that collates all the information that is needed to make a diagnosis of a problem with your setup.

This information is referred to as a report or report.txt.

There are 3 ways to provide us (at the forum) with this information.

-
- from the console (if booted from floppy).

login as root and type 2 commands.

```
report
```

```
halt
```

Once the system is halted you may take the floppy and copy
A:\\ROUTER\\REPORT.TXT to your other PC. Put the floppy back in the
freesco machine and boot it back up.

-
- from the console (if booted from harddrive).

login as root and type these commands.

```
report
```

```
mount -t msdos /dev/fd0 /fd
```

```
cp /mnt/router/report.txt /fd
```

Generic: Creating a "report"?

sync

umount /fd

Now you may take the floppy and copy A:\\REPORT.TXT to another PC with working internet and post it on the forum.

- Via the web admin page (if you enabled it).

Login as admin via <http://your.freesco.ip:82> (port 82 is default for web control panel, this port is configurable in `[b]setup[/b]`, so use that port if you've used something else than the default).

Use the "Info/System" link, and copy all text from the main frame.

If your FREESCO 0.2.7 box is hanging at the "waiting for DHCP offer..." message, you can get in by typing ALT+F2 on the console and login as root at the new login prompt. Then proceed with method 1 or 2 (method 3 won't work because the web panel hasn't started yet).
